SILENT ANIMALS

 **Animals That Produce No Sound** 

Giraffe

Giraffes do not roar or make noise. They use body language and low-frequency vibrations that humans cannot hear.

Sloth

Sloths move very slowly and rarely make any sound. They use scent and slow actions to connect with others.

Snail

Snails move slowly and silently. They communicate by touch and chemical scents called pheromones.

Starfish

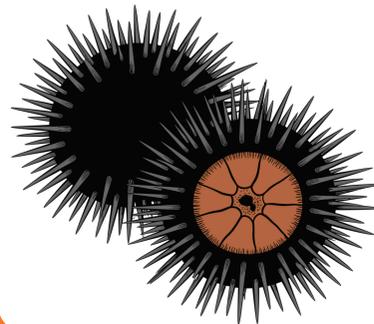

Starfish are completely quiet. They have no organs to make sound and communicate through chemical signals.

Jellyfish

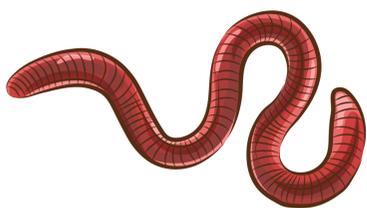

Jellyfish are completely soundless because they have no brain, lungs, or vocal cords. They send signals by pulsing or glowing.

Sea Urchin

Sea urchins are quiet ocean animals. They use touch and movement to sense their surroundings.

Worm

Worms make no sound at all. They sense vibrations in the soil to detect food or danger.

Octopus

Octopuses make no sound. They change colour and shape to express feelings or hide from enemies.
